

EMF Balance

Most people are now familiar with the effects of stray voltage on animals and people, but few know the effect of passing water lines over or near electrical wiring.

These are some of the revelations we have observed in Michigan and Wisconsin with dairy cows,

- 1 Cows lapping at the water and not consuming the desired daily intake.
- 2 50% of the nutrients in the feed pass through the digestive system and end up in the manure.
- 3 Animals consuming more feed than the body condition and milk production is reflecting.

It is our opinion that the frequencies riding on the electrical wiring is the cause, and is affecting the utilization of water and other nutrients in the animals diet.

On one farm in Wisconsin a 20 lb + increase in milk was achieved per cow each day by removing the electrical fields from the water line.

There may be a connection to this phenomena and dry tough meat found at the meat counter in grocery stores.
